History of A-Tools

The "A" in *A-Tools* stands for *Avatars*.

Well, with *AJS (Avatars Jet Systems)* and *TiS (Think in Systems)* it was somehow necessary to explain how it is possible to put the Enterprise Business Software *TiS* with its rich functionality, exceptional composition, and superior state-of-the-art technology on the market by just a handful of people.

A-Tools is a web-based business software generator based on the definition of an application. We can also think of it as **WYDIWYG** – **W**hat **Y**ou **D**efine, **I**s **W**hat **Y**ou **G**et. The concept of *A-Tools* was outlined in 2003.

The entire process from defining a standard application till it is deployed takes about 15 minutes compared to approximately 3 days by traditional web-based programming. And you can regenerate it at any time. And this makes *A-Tools* avatar-like.

Any expansion of *A-Tools* with new state-of-the-art functionality is available in *TiS* – more or less – next day by simply regenerating all applications. And this is not limited to standard applications. Any customization can be made as a part of the definition of a page.

Right now, *A-Tools* can only generate web-based JAVA applications. By 2017, *A-Tools* will also generate Android applications for any Android-based smart device in also 15 minutes.
